

# Data Input

## Module 4

*Andrew Jaffe*

*June 15, 2105*

## Data Input

- We used several pre-installed sample datasets during previous modules (`CO2`, `iris`)
- However, ‘reading in’ data is the first step of any real project/analysis
- R can read almost any file format, especially via add-on packages
- We are going to focus on simple delimited files first
  - tab delimited (e.g. ‘.txt’)
  - comma separated (e.g. ‘.csv’)
  - Microsoft excel (e.g. ‘.xlsx’)

## Data Input

`read.table()`: Reads a file in table format and creates a data frame from it, with cases corresponding to lines and variables to fields in the file.

```
# the four ones I've put at the top are the important inputs
read.table( file, # filename
            header = FALSE, # are there column names?
            sep = ",", # what separates columns?
            as.is = !stringsAsFactors, # do you want character strings as factors or characters?
            quote = "\"", dec = ".", row.names, col.names,
            na.strings = "NA", nrows = -1,
            skip = 0, check.names = TRUE, fill = !blank.lines.skip,
            strip.white = FALSE, blank.lines.skip = TRUE, comment.char = "#",
            stringsAsFactors = default.stringsAsFactors())

# for example: `read.table("file.txt", header = TRUE, sep="\t", as.is=TRUE)`
```

## Data Input

- The filename is the path to your file, in quotes
- The function will look in your “working directory” if no absolute file path is given
- Note that the filename can also be a path to a file on a website (e.g. ‘`www.someurl.com/table1.txt`’)

## Data Aside

- Everything we do in class will be using real publicly available data - there are few ‘toy’ example datasets and ‘simulated’ data
- OpenBaltimore and Data.gov will be sources for the first few days

## Data Input

Monuments Dataset: “This data set shows the point location of Baltimore City monuments. However, the completeness and currentness of these data are uncertain.”

- Navigate to: <https://data.baltimorecity.gov/Community/Monuments/cpxf-kxp3>
- Export -> Download -> Download As: CSV
- Save it (or move it) to the same folder as your day1.R script
- Within RStudio: Session -> Set Working Directory -> To Source File Location

## Data Input

There is a ‘wrapper’ function for reading CSV files:

```
read.csv
```

```
## function (file, header = TRUE, sep = ",", quote = "\"", dec = ".",  
##     fill = TRUE, comment.char = "", ...)  
## read.table(file = file, header = header, sep = sep, quote = quote,  
##     dec = dec, fill = fill, comment.char = comment.char, ...)  
## <bytecode: 0x000000000a4e3370>  
## <environment: namespace:utils>
```

Note: the ... designates extra/optional arguments that can be passed to `read.table()` if needed

## Data Input

- Starting out, you can use RStudio -> Tools -> Import Dataset -> From Text File and select

```
mon = read.csv("../data/Monuments.csv",header=TRUE,as.is=TRUE)  
head(mon)
```

	name	zipCode	neighborhood	councilDistrict
1	James Cardinal Gibbons	21201	Downtown	11
2	The Battle Monument	21202	Downtown	11
3	Negro Heroes of the U.S Monument	21202	Downtown	11
4	Star Bangled Banner	21202	Downtown	11
5	Flame at the Holocaust Monument	21202	Downtown	11
6	Calvert Statue	21202	Downtown	11

  

	policeDistrict	Location.1
1	CENTRAL	408 CHARLES ST\nBaltimore, MD\n
2	CENTRAL	
3	CENTRAL	
4	CENTRAL	100 HOLLIDAY ST\nBaltimore, MD\n
5	CENTRAL	50 MARKET PL\nBaltimore, MD\n
6	CENTRAL	100 CALVERT ST\nBaltimore, MD\n

## Data Input

```
> colnames(mon)
```

```
[1] "name"          "zipCode"        "neighborhood"   "councilDistrict"  
[5] "policeDistrict" "Location.1"
```

```
> head(mon$zipCode)
```

```
[1] 21201 21202 21202 21202 21202 21202
```

```
> head(mon$neighborhood)
```

```
[1] "Downtown" "Downtown" "Downtown" "Downtown" "Downtown" "Downtown"
```

## Aside: Working Directory

- R looks for files on your computer relative to the “working” directory
- It’s always safer to set the working directory at the beginning of your script. Note that setting the working directory created the necessary code that you can copy into your script.
- Example of help file

```
> ## get the working directory  
> getwd()  
> # setwd("~/Dropbox/summerR_2015/Lectures")
```

## Aside: Working Directory

- Setting the directory can sometimes be finicky
  - Windows: Default directory structure involves single backslashes (“\”), but R interprets these as “escape” characters. So you must replace the backslash with forward slashes (“/”) or two backslashes (“\\”)
  - Mac/Linux: Default is forward slashes, so you are okay
- Typical linux/DOS directory structure syntax applies
  - “..” goes up one level
  - “./” is the current directory
  - “~” is your home directory

## Working Directory

Try some directory navigation:

```
> dir("./") # shows directory contents
```

```
[1] "module1.html"  "module1.pdf"    "module1.R"  
[4] "module1.Rmd"   "module2.html"   "module2.pdf"  
[7] "module2.R"     "module2.Rmd"    "module3.html"  
[10] "module3.pdf"   "module3.R"      "module3.Rmd"  
[13] "module4.html"  "module4.R"      "module4.Rmd"  
[16] "module5.html"  "module5.Rmd"    "module6.html"  
[19] "module6.Rmd"   "renderModules.R" "styles.css"
```

```
> dir("../")
```

```
[1] "data"      "docs"      "index.html" "index.Rmd"  "labs"
[6] "modules"   "pdf"       "README.md"
```

## Working Directory

- Copy the code to set your working directory from the History tab in RStudio (top right)
- Confirm the directory contains “day2.R” using `dir()`

## Data Input

The `read.table()` function returns a `data.frame`

```
> class(mon)
```

```
[1] "data.frame"
```

```
> str(mon)
```

```
'data.frame':  84 obs. of  6 variables:
 $ name      : chr  "James Cardinal Gibbons" "The Battle Monument" "Negro Heroes of the U.S Monume
 $ zipCode    : int  21201 21202 21202 21202 21202 21202 21202 21202 21211 21213 21211 ...
 $ neighborhood : chr  "Downtown" "Downtown" "Downtown" "Downtown" ...
 $ councilDistrict: int  11 11 11 11 11 11 11 7 14 14 ...
 $ policeDistrict : chr  "CENTRAL" "CENTRAL" "CENTRAL" "CENTRAL" ...
 $ Location.1   : chr  "408 CHARLES ST\nBaltimore, MD\n" "" "" "100 HOLLIDAY ST\nBaltimore, MD\n" ...
```

## Data Input

Changing variable names in `data.frames` works using the `names()` function, which is analogous to `colnames()` for data frames (they can be used interchangeably)

```
> names(mon)[1] = "Name"
> names(mon)
```

```
[1] "Name"      "zipCode"    "neighborhood" "councilDistrict"
[5] "policeDistrict" "Location.1"
```

```
> names(mon)[1] = "name"
> names(mon)
```

```
[1] "name"      "zipCode"    "neighborhood" "councilDistrict"
[5] "policeDistrict" "Location.1"
```

## Data Subsetting

Now we will introduce subsetting rows/observations of data using logical statements. Recall that the `logical` class consists of either `TRUE` or `FALSE`

```
> z = c(TRUE,FALSE,TRUE,FALSE)
> class(z)
```

```
[1] "logical"
```

```
> sum(z) # number of TRUEs
```

```
[1] 2
```

## Data Subsetting

And recall again that the logical class does NOT use quotes.

```
> z2 = c("TRUE","FALSE","TRUE","FALSE")
> class(z2)
```

```
[1] "character"
```

```
> # sum(z2)
> identical(z,z2)
```

```
[1] FALSE
```

Useful: `identical()` checks if two R objects are exactly identical/equal.

## Logical Statements

Almost every R object can be evaluated and converted to the `logical` class using different logical statements (this mirrors computer science/programming syntax)

- `'=='`: equal to
- `'!='`: not equal to (it is NOT `'~'` in R, e.g. SAS)
- `'>'`: greater than
- `'<'`: less than
- `'>='`: greater than or equal to
- `'<='`: less than or equal to

## Logical Statements

```
> x = 1:6
> x > 4
```

```
[1] FALSE FALSE FALSE FALSE  TRUE  TRUE
```

```
> x == 3
```

```
[1] FALSE FALSE TRUE FALSE FALSE FALSE
```

## Logical Statements

These logical statements can be then used to subset your data.

```
> Index = (mon$zipCode == 21202)
> sum(Index)
```

```
[1] 16
```

```
> table(Index)
```

```
Index
FALSE  TRUE
   68    16
```

```
> mon2 = mon[Index,]
```

## Logical Statements

```
> dim(mon2)
```

```
[1] 16 6
```

```
> head(mon2)
```

		name	zipCode	neighborhood
2		The Battle Monument	21202	Downtown
3		Negro Heroes of the U.S Monument	21202	Downtown
4		Star Bangled Banner	21202	Downtown
5		Flame at the Holocaust Monument	21202	Downtown
6		Calvert Statue	21202	Downtown
7		War Memorial Building/Aquatic Wa	21202	Downtown
	councilDistrict	policeDistrict		Location.1
2	11	CENTRAL		
3	11	CENTRAL		
4	11	CENTRAL	100 HOLLIDAY ST\n	Baltimore, MD\n
5	11	CENTRAL	50 MARKET PL\n	Baltimore, MD\n
6	11	CENTRAL	100 CALVERT ST\n	Baltimore, MD\n
7	11	CENTRAL	101 GAY ST\n	Baltimore, MD\n

## Which

`which()`: “Give the TRUE indices of a logical object, allowing for array indices.”

```
> mon$Location.1 != ""
```

```
[1] TRUE FALSE FALSE TRUE TRUE TRUE TRUE TRUE TRUE FALSE TRUE
[12] FALSE FALSE TRUE TRUE FALSE TRUE TRUE TRUE TRUE TRUE TRUE
[23] TRUE TRUE TRUE TRUE TRUE TRUE TRUE TRUE FALSE TRUE TRUE TRUE
[34] TRUE TRUE TRUE TRUE TRUE FALSE FALSE TRUE TRUE TRUE TRUE
[45] TRUE TRUE TRUE FALSE FALSE TRUE FALSE FALSE FALSE TRUE TRUE
[56] FALSE TRUE TRUE TRUE TRUE TRUE TRUE FALSE FALSE FALSE FALSE
[67] FALSE TRUE TRUE TRUE TRUE TRUE TRUE TRUE FALSE FALSE TRUE FALSE
[78] TRUE TRUE TRUE TRUE FALSE FALSE TRUE
```

```
> which(mon$Location.1 != "")
```

```
[1] 1 4 5 6 7 8 9 11 14 15 17 18 19 20 21 22 23 24 25 26 27 28 29
[24] 31 32 33 34 35 36 37 38 41 42 43 44 45 46 47 50 54 55 57 58 59 60 61
[47] 68 69 70 71 72 73 76 78 79 80 81 84
```

## Missing Data

- In R, missing data is represented by the symbol `NA` (note that it is NOT a character, and therefore not in quotes, just like the `logical` class)
- `is.na()` is a logical test for which variables are missing
- Many summarization functions do not the calculation you expect (e.g. they return `NA`) if there is ANY missing data, and these often have an argument `na.rm=FALSE`. Changing this to `na.rm=TRUE` will ignore the missing values in the calculation (i.e. `mean()`, `median()`, `max()`, `sum()`)

Here is a good link with more information: <http://www.statmethods.net/input/missingdata.html>
