Variables

Module 2

Andrew Jaffe
June 15, 2105

Getting Started

- You should have the latest version of R installed (R 3.2.0 as of 6/15/2015)!
- Open R Studio
- Files -> New -> R Script
- Save the blank R script as "day1.R" in a directory of your choosing
- Add a comment header

Commenting in Scripts

Add a comment header to day1.R :# is the comment symbol

Explaining output on slides

In slides, a command (we'll also call them code or a code chunk) will look like this

```
> print("I'm code")
[1] "I'm code"
```

And then directly after it, will be the output of the code. So print("I'm code") is the code chunk and [1] "I'm code" is the output.

R as a calculator

> 2 + 2

[1] 4

> 2 * 4

[1] 8

> 2^3

[1] 8

Note, when you type your command, R inherently thinks you want to print the result.

R as a calculator

- The R console is a full calculator
- Try to play around with it:
 - -+,-,/,* are add, subtract, multiply, and divide
 - ^ or ** is power
 - parentheses (and) work with order of operations

R as a calculator

> 2 + (2 * 3)^2

[1] 38

> (1 + 3) / 2 + 45

[1] 47

R as a calculator

Try evaluating the following:

- \bullet 2 + 2 * 3 / 4 -3
- 2 * 3 / 4 * 2
- 2⁴ 1

- R uses "=" or "<-" to assign values to a variable name
- Variable names are case-sensitive, i.e. X and x are different

[•] You can create variables from within the R environment and from files on your computer

```
> x = 2 # Same as: x <- 2
> x

[1] 2
> x * 4

[1] 8
> x + 2
```

[1] 4

R variables

- The most comfortable and familiar class/data type for many of you will be data.frame
- You can think of these as essentially Excel spreadsheets with rows (usually subjects or observations) and columns (usually variables)
- \bullet Go to RStudio -> Tools -> Import Dataset -> From Web URL then paste

http://www.aejaffe.com/summerR_2015/data/Charm_City_Circulator_Ridership.csv

R variables

• We can display the top of the data with head:

> head(Charm_City_Circulator_Ridership)

	day	date	orangeBo	ardings	orangeAl	ightings	orangeAverage		
1	Monday	01/11/2010		877		1027	952.0		
2	Tuesday	01/12/2010		777		815	796.0		
3	Wednesday	01/13/2010		1203		1220	1211.5		
4	Thursday	01/14/2010		1194		1233	1213.5

4	NA	1213.5			
5	NA	1644.0			
6	NA	1490.5			

R variables

- data.frames are somewhat advanced objects in R; we will start with simpler objects;
- Here we introduce "1 dimensional" classes; these are often referred to as 'vectors'
- Vectors can have multiple sets of observations, but each observation has to be the same class.

```
> class(x)

[1] "numeric"

> y = "hello world!"

> print(y)

[1] "hello world!"

> class(y)
```

[1] "character"

R variables

Try assigning your full name to an R variable called name

R variables

Try assigning your full name to an R variable called name

```
> name = "Andrew Jaffe"
> name
```

[1] "Andrew Jaffe"

The 'combine' function

The function c() collects/combines/joins single R objects into a vector of R objects. It is mostly used for creating vectors of numbers, character strings, and other data types.

```
> x <- c(1, 4, 6, 8)
> x
```

[1] 1 4 6 8

```
> class(x)
```

[1] "numeric"

The 'combine' function

Try assigning your first and last name as 2 separate character strings into a single vector called name2

The 'combine' function

Try assigning your first and last name as 2 separate character strings into a length-2 vector called name2

```
> name2 = c("Andrew", "Jaffe")
> name2
```

[1] "Andrew" "Jaffe"

R variables

length(): Get or set the length of vectors (including lists) and factors, and of any other R object for which a method has been defined.

```
> length(x)
```

[1] 4

> y

[1] "hello world!"

```
> length(y)
```

[1] 1

R variables

What do you expect for the length of the name variable? What about the name2 variable?

What are the lengths of each?

R variables

What do you expect for the length of the name variable? What about the name2 variable? What are the lengths of each?

```
> length(name)
[1] 1
```

```
> length(name2)
```

[1] 2

R variables

You can perform functions to entire vectors of numbers very easily.

```
> x + 2
[1] 3 6 8 10
> x * 3
[1] 3 12 18 24
> x + c(1, 2, 3, 4)
```

R variables

[1] 2 6 9 12

But things like algebra can only be performed on numbers.

```
> name2 + 4
[1] Error in name2 * 4 : non-numeric argument
to binary operator
```

R variables

And save these modified vectors as a new vector.

```
y = x + c(1, 2, 3, 4)
> y
```

```
[1] 2 6 9 12
```

Note that the R object y is no longer "Hello World!" - It has effectively been overwritten by assigning new data to the variable

R variables

• You can get more attributes than just class. The function str gives you the structure of the object.

```
> str(x)
num [1:4] 1 4 6 8
> str(y)
num [1:4] 2 6 9 12
```

This tells you that x is a numeric vector and tells you the length.

Basic Summarization

Here are some simple functions for making calculations on data.

sum(): takes the sum of all numeric variables in a vector

mean(): takes the mean of all numeric variables in a vector

median(): takes the median of all numeric variables in a vector

Back to our data.frame example

• Let's see what the structure of our data.frame is:

```
> str(Charm_City_Circulator_Ridership)
'data.frame': 1146 obs. of 15 variables:
```

```
$ day
                  : Factor w/ 7 levels "Friday", "Monday", ...: 2 6 7 5 1 3 4 2 6 7 ....
                  : Factor w/ 1146 levels "01/01/2011", "01/01/2012", ...: 31 35 39 43 47 51 55 59 63 67
$ date
$ orangeBoardings : int 877 777 1203 1194 1645 1457 839 999 1023 1375 ...
$ orangeAlightings: int
                        1027 815 1220 1233 1643 1524 938 1000 1047 1416 ...
$ orangeAverage
                 : num
                        952 796 1212 1214 1644 ...
$ purpleBoardings : int
                        NA NA NA NA NA NA NA NA NA ...
$ purpleAlightings: int NA ...
$ purpleAverage
                : num NA NA NA NA NA NA NA NA NA ...
$ greenBoardings : int
                        NA NA NA NA NA NA NA NA NA ...
$ greenAlightings : int NA ...
$ greenAverage
                 : num NA NA NA NA NA NA NA NA NA ...
$ bannerBoardings : int NA ...
$ bannerAlightings: int NA ...
$ bannerAverage : num NA ...
$ daily
                  : num 952 796 1212 1214 1644 ...
```

Review

- Creating a new script
- Using R as a calculator
- Assigning values to variables
- Performing algebra on numeric variables
